Scenario

The ambulance arrived at the scene minutes after the cabs collided, one yellow taxi T-boned into another in a busy Manhattan intersection. Shattered glass covered the street as a woman, still in the back seat of one of the cabs, clutched her neck in pain. This and countless other tales of catastrophe have occurred due to careless cab drivers chatting on cell phones. Increased risk of accidents, negative atmosphere, and city income are just some of the reasons New York City police officers should better enforce the law banning cab drivers from using cell phones while driving.

Description

Student work posted around the room, lessons that are applied to real life situations, and extra help offered after school, this is our sixth grade math class. With a math teacher like this, why wouldn't you want an hour-long class? Math in Terrill should be increased from forty-two minutes to one hour to help students better prepare for the upcoming math in seventh grade, help students succeed in applying to high school and college, and assist in solving financial problems during adulthood.

Shocking Statement/ Statistic

New York City police gave one ticket to every cab driver per 517, 241 cab rides in a six month period. By this fact, it is obvious that authorities are heavily overlooking the negligent use of cell phones by cab drivers. Using cellphones while driving increases the risk of accidents, creates a negative atmosphere in the cab, and endangers pedestrians. Because of these reasons and many more, New York City police officers should better enforce the law banning cab drivers from using cellphones while driving.

Quote

Albert Einstein once said, "Do not worry about your difficulties in mathematics, I assure you that mine are greater." Einstein shows us that math can be a tough subject in which many people have trouble. To help students overcome their mathematical difficulties, it may be helpful to increase math classes to one hour in length. Additionally, to assist students in better preparing for harder math in high school, succeeding in applying to high school and college, and solving financial problems during adulthood, the length of math classes should be increased to an hour.

Interesting fact

Believe it or not, a third of New York City taxi drivers talk on cell phones while bringing customers to their destinations. If caught using a phone while driving, taxi drivers can face a \$200 fine. Despite the growing instances of cell phone use by taxi drivers, police are not strictly enforcing the law. The quickly growing use of cell phones while driving is endangering passengers and pedestrians. An increased risk of accidents, a negative atmosphere, and unsafe sidewalks are just some of the reasons New York City police officers should enforce the cell phone ban.

Figurative language (metaphor or simile)

Our brains are a flower for which math is the bee, providing the essential elements to help us grow. Math provides several ways for students to grow intellectually and socially; however, math is used a lot outside of the classroom and later in life. Math allows us to exercise our mind, while reflecting on different ways to solve problems. The necessity of well-developed math skills in today's society demonstrates the importance of increasing the forty-two minute math periods to one hour in length. There are several important reasons to increase math periods, such as preparing students for harder math in later grades, aiding students in applying to high school and college, and assisting students in solving financial problems during adulthood.
